

DUAL CAMERA SYSTEM

2:1 Ratio

4:1 Ratio

Advantages of the Dual Camera System

1. No moving parts between the dual magnifications per objective since the switching is done through software program control.
2. Since fixed magnification lenses are used, there is no need to recalibrate each time before measurement as in zoom systems.
3. Fixed detents between objectives provide better repeatability of lens positioning through sensor control.
4. Wider choice of lenses provide a high degree of flexibility:
(2.5X, 5X, 10X, 20X, 40X, 50X and 100X)
5. Magnifications between dual cameras can vary from 4:1 to 2:1 ratios.
6. Offers excellent repeatability and accuracy when combined with our patented Light Calibration System.
7. Factory proven components from Olympus provide flat field, low distortion images for repeatable measurements.
8. System throughput increases since the dual cameras are switched through software.
